Advanced User Activity Tracking System

Status: Open

Project Description

This project involves building an advanced user activity tracking system to monitor how users interact with a digital platform. The objective is to collect meaningful behavioral data that can be used to improve user experience, system performance, and content effectiveness. The tracking system should capture actions such as page views, clicks, content completion, time spent, and navigation paths.

The system must be designed with performance in mind, ensuring that tracking does not negatively affect application responsiveness. Data should be stored efficiently and structured in a way that supports future analytics and reporting. Event definitions must be clearly documented so that collected data remains consistent and understandable.

Privacy and transparency are critical requirements. The system should allow configuration of what data is collected and respect basic consent principles. Sensitive information must not be logged unnecessarily. Security measures should protect tracking data from unauthorized access.

The final solution should include dashboards or data export capabilities for analysis. Clear documentation must explain event configuration, data usage, and maintenance procedures. The goal is to provide actionable insights while maintaining system reliability and user trust.

Project Details

Budget: \$1,800.00

Deadline: Aug 22, 2026

Experience Required: 4 years
